

Erich L. Lehmann, The Lehmann Symposia, and November 20th, 1917

Javier Rojo¹

Rice University

The Lehmann Symposia originated as a result of a conversation I had in the year 2001 with the, then, Director of the Centro de Investigación en Matemáticas (CIMAT), Victor Perez-Abreu. We both felt that there was an urgent need to bring back into focus theoretical statistics and our proposed solution was a series of Symposia that could serve as a forum for some of the exciting theoretical work being done in statistics. The First Lehmann Symposium took place at CIMAT in May of 2002. Most of the participants were Mexican colleagues. The program can be seen at the site <http://www.stat.rice.edu/lehmann/1st-Lehmann.html>. The second Lehmann Symposium – <http://www.stat.rice.edu/lehmann/> – was held in May of 2004 at the School of Engineering at Rice University. Initially, the venues for the Symposia would alternate between CIMAT and Rice University. However, for various reasons, some being financial, it was decided to hold the 3rd Lehmann Symposium in the United States.

The original plans for the Third Lehmann Symposium were to hold the symposium at the Mathematical Sciences Research Institute (MSRI) at Berkeley during the month of November of 2007. The Third Symposium, however, ended up being held at Rice University for a second time during May of 2007. See <http://www.stat.rice.edu/~jrojo/3rd-Lehmann/>. I co-edited webcasts of the Second and Third Symposia, and these webcasts are freely available to the public. They can be found at the following sites:

<http://webcast.rice.edu/webcast.php?action=details&event=408> — second symposium, and

<http://webcast.rice.edu/webcast.php?action=details&event=1057> — third symposium.

But why was the venue for the Third Symposium changed from California back to Texas, and why was the date changed from November 20th 2007 to May 16th, 2007? There were very good reasons for holding the opening of the Symposium on November 20th, 2007. For example, November 20th, 2007 was the silver anniversary of the greatest big game of all time. See, for example: http://www.alumni.berkeley.edu/KCAA_Multimedia/The_Play_1982.asp. Another good reason to start the Symposium on November 20th was to co-celebrate, with our Mexican counterparts, the start of the first major 20th century revolution. The Mexican revolution started on November 20th, 1910 to remove the dictator Porfirio Diaz from power. This revolution led to the Constitution of 1917 and the start of the Partido Revolucionario Institucional that held power until the general election of 2000. Francisco I. Madero, supported by, among others, Francisco Villa, took over from Porfirio Diaz.

Francisco Villa

Porfirio Diaz

Francisco I. Madero

The Consitution of 1917, signed in February 5th of that year, is the current Mexican Constitution. The year of 1917, as it turned out, was a very significant year in the history of the world.

Some of the Significant Events of 1917

January 28 - The United States ends search for Pancho Villa.

February 5 - Mexican Constitution is adopted.

February 24 - World War I: United States ambassador to the United Kingdom Walter H. Page is given the Zimmermann Telegram, in which Germany offers to give the American Southwest back to Mexico, if Mexico will declare war on the United States.

March 31 - The United States takes possession of the Virgin Islands after paying \$25 million to Denmark.

April 6 - The United States declares war on Germany.

April 16 - Lenin arrives in Petrograd.

May 18 - The Selective Service Act passes the U.S. Congress giving the President the power of conscription.

July 4 - Petrograd Street demonstration The Bolshevik revolution looms in the horizon.

November 7 - Bolshevik Revolution begins: The workers of St. Petersburg in Russia, led by the Bolsheviks and the Bolshevik leader Vladimir Lenin, attacked the ineffective Kerensky Provisional Government.

November 20 - Ukraine is declared a republic.

November 20, 1917 and Beyond

Amidst the shadows of war and unrest, a small burst of light began to shine in Strasbourg, France. Erich Leo Lehmann was born November 20th, 1917 – a mere 7 months after The United States entered the First World War.

1 Some years later, at the age of 16, he and his family went to live in Switzerland 1
2 to avoid the Nazis. After five years in Switzerland, and two years at Cambridge, 2
3 Erich L. Lehmann arrived in the United States in 1940 with a letter of introduction 3
4 from the wife of Edmund Landau. Landau had passed away a couple of years earlier 4
5 from a heart attack. The letter of introduction was for Richard Courant who was 5
6 in New York and had been a colleague of Landau in Göttingen. After being asked 6
7 by Courant if he wanted to stay in New York or live in the United States, Lehmann 7
8 responded that he wanted to live in the United States and then followed Courant's 8
9 advice to go to an "up-and-coming university" in Berkeley, California. Upon his 9
10 arrival in Berkeley in 1941, Erich Lehmann met with Griffith C. Evans who had 10
11 been a mathematician at the Rice Institute, now Rice University. Evans had been 11
12 brought to Berkeley to develop the mathematics department that was in disarray. 12
13 Evans was an excellent mathematician and many of his contributions as a math- 13
14 ematician and administrator have been recorded in Morrey (1983) and Lehmann 14
15 (2007). As an administrator, Evans was able to attract to Berkeley some of the best 15
16 mathematicians of the time. With a broad vision for the mathematics department, 16
17 Evans supported a three-week visit by R. A. Fisher to Berkeley. The visit did not go 17
18 well. Reid (1992) writes in her book that, despite a generous endowed lectureship 18
19 whose terms required the lecturer to spend their time on campus to interact with 19
20 interested faculty, Fisher spent the first five days of his visit in San Francisco and 20
21 went back to England a day earlier "standing up a dinner in his honor". Reid (1992) 21
22 writes that according to Raymond T. Birge, chair of the Physics department at the 22
23 time, "Fisher was the most conceited man he had ever met - 'and that is saying 23
24 a lot with such competitors as Millikan et al!'" Birge put forth Neyman's name 24
25 to Evans. Evans had never heard of Neyman but after some inquiring an offer was 25
26 made. Neyman accepted and a few years later, after an offer from Columbia became 26
27 available, was able to negotiate with Evans for the creation of a separate statistics 27
28 department. These and other fascinating details may be found in Lehmann (1993, 28
29 1996, and 2007) and Reid (1992) and other references in the bibliography. 29

30 After completing the required course work, and after returning from Guam where 30
31 he and Joseph Hodges had served, it was time for Erich L. Lehmann to begin work 31
32 on a dissertation. A topic with a probabilistic flavor was proposed by Pao-Lu Hsu 32
33 after consulting with Neyman. Progress was swift and as Lehmann prepared to write 33
34 up some of the results, a reference led to other references that led to the painful 34
35 discovery that the results so far obtained had been published a few decades earlier. 35
36 At that time Neyman was invited as a member of a delegation to observe the Greek 36
37 elections. Concerned with the disappointment of his student, and knowing that he 37
38 might return until a few months later, Neyman asked Hsu to consider providing 38
39 a new problem for Lehmann's thesis. Hsu suggested a new problem that he had 39
40 thought about and planned to work on, and a problem for which he already had 40
41 some preliminary results. Lehmann came to know about Hsu's generosity some time 41
42 later and had hoped to thank Hsu personally after Hsu's return to Berkeley from 42
43 Columbia, but this would never happen as Hsu opted to return to China. With 43
44 Neyman in Greece and Hsu back in China, Neyman suggested George Polya as a 44
45 surrogate advisor. Frequent visits to Polya at Stanford finally yielded a thesis. A 45
46 new problem presented itself in that Polya was not a faculty member at Berkeley. 46
47 Fortunately, Neyman was able to return in time for the thesis defense. He had been 47
48 asked to return to the United States as his services were no longer needed in Greece. 48
49 In effect, he had been dismissed for insubordination. He had decided to investigate 49
50 on his own the possibility that the elections had been rigged. It thus happened that 50
51 in 1946 Erich L. Lehmann received the degree of Doctor of Philosophy. The title of 51

his thesis: “Optimum Tests of a Certain Class of Hypotheses Specifying the Value of a Correlation Coefficient”.

Erich L. Lehmann stayed in Berkeley as a young faculty member and the “Rest of the story” is well known. Besides his many influential publications, he was able to produce 41-plus Ph.D. students. The following table provides the names of the students and the year of graduation.

Colin Ross Blyth	1950	Gouri Kanta Bhattacharyya	1966
Fred Charles Andrews	1953	James Nwoye Adichie	1966
Allan Birnbaum	1954	Dattaprabhakar V. Gokhale	1966
Hendrik Salomom Konijn	1954	Frank Rudolph Hampel	1968
Balkrishna V. Sukhatme	1955	Wilhelmine von Turk Stefansky	1969
V. J. Chacko	1959	Louis Jaeckel	1969
Piotr Witold Mikulski	1961	Friedrich Wilhelm Scholz	1971
Madan Lal Puri	1962	Dan Anbar	1971
Krishen Lal Mehra	1962	Michael Denis Stuart	1972
Subha Bhuchongkul Sutthritpongsa	1962	Claude L. Guillier	1972

William Harvey Lawton	1965	Marc J. Sobel	1983
Shulamith Gross	1966	Javier Rojo	1984
Bruce Hoadley	1966		

So why, then, was the date changed from November 20th to May 16th? After all, it would have been a great way of celebrating Erich’s wonderful 90 years of life. But that is precisely the issue. To the reader who does not know Erich L. Lehmann personally, holding a conference on his birthday, a conference that is named after him, would seem only natural. However, those close to him know very well that he is very modest and an event like the Symposium held on his birthday, would be rather uncomfortable for him. He thought that the meeting would turn into a birthday celebration and he would not have it that way. The Lehmann Symposia should be true to its beginnings: A meeting to showcase good theoretical work. Thus, it came to be that the venue and date for the 3rd Lehmann Symposium was changed. As it was not possible to celebrate his 90th birthday with the symposium, this volume is dedicated to Erich’s 90th birthday. I am sure that, given the opportunity, all his Ph.D. students listed above and colleagues around the world join me in wishing Erich Leo Lehmann many more wonderful years! Our lives have been greatly enriched through our interactions, professional and social, with him.
